Purpose Statement

- ▶ Identify Texas acute care hospitals and performance areas that may warrant additional quality improvement support using transparent CMS quality, patient experience, and readmission measures.

Tell Your Story

- ▶ Data source: CMS Care Compare hospital quality datasets for Texas hospitals
- ▶ Records analyzed: 285 Texas acute care hospitals after cleaning and filtering
- ▶ Time period: 2025 CMS reporting data; measurement periods vary by quality measure.
- ▶ Key variables: CMS Overall Rating, hospital ownership, six HCAHPS patient experience measures, hospital wide readmission rate, and CMS readmission comparison
- ▶ Tools: Excel and Power Query
- ▶ Limitations: Overall rating availability was substantially lower than HCAHPS and readmission coverage, limiting complete screening for about 30% of hospitals. Results are hospital level observational comparisons; the screening flags are prioritization tools and do not establish causation or constitute a validated overall quality score.

Finding 1: Most Rated Hospitals Fell in the 3-4 Star Range

- ▶ 47.0% received 4-5 stars.
- ▶ 21.0% received 1-2 stars.
- ▶ Four star hospitals were the largest single category at 34.5%, but the distribution still contains a meaningful lower rated group for investigation.

Finding 2: Medicine Communication Is the Weakest Statewide HCAHPS Measure

- ▶ Highest median: Discharge Information (86%)
- ▶ Lowest median: Medicine Communication (61%)
- ▶ Among ownership groups with at least 10 hospitals, physician owned hospitals had the strongest averages on most HCAHPS measures, while proprietary hospitals had the lowest across all six.

Finding 3: Most Texas Hospitals Were Statistically Similar to National Readmission Performance

- ▶ No Different: 93.3%
- ▶ Worse: 3.9%
- ▶ Better: 2.8%
- ▶ The CMS comparison category separates relatively few hospitals, so it is useful as a targeted flag rather than a broad ranking tool.

Finding 4: Higher Recommendation Is Modestly Associated With Lower Readmission

- ▶ $r = -0.301$ | $N = 250$
- ▶ Lowest recommendation quartile: 15.15% average readmission
- ▶ Highest recommendation quartile: 14.77%

Finding 5: 37 Hospitals Met Multiple Transparent Screening Conditions

- ▶ Priority 1: 3
- ▶ Priority 2: 34
- ▶ Total with ≥ 2 signals: 37
- ▶ Priority 1 hospitals
 - ▶ HCA Houston Healthcare Conroe
 - ▶ Medical City Arlington
 - ▶ Medical City Fort Worth
- ▶ Proprietary hospitals represented 27 of the 37 Priority 1-2 hospitals and had the highest within group share at 23.9%. This pattern is descriptive and does not establish an ownership effect.

Conclusion

- ▶ The analysis identified statewide patient experience opportunities and 37 hospitals with multiple screening concerns. These results provide a focused starting point for deeper quality review rather than a definitive ranking of hospital quality.
- ▶ Recommendations
 - ▶ Prioritize review of the 37 hospitals with multiple screening signals, beginning with the three hospitals that met all three conditions.
 - ▶ Investigate Medicine Communication as a statewide patient experience improvement area, comparing practices at stronger performing hospitals to identify potential process improvements.
 - ▶ Use ownership results to guide deeper investigation, particularly the higher concentration of Priority 1-2 results among proprietary hospitals, while treating ownership as a descriptive grouping rather than a causal explanation.
- ▶ Next steps
 - ▶ Add longitudinal, risk adjusted, and operational data to determine whether the identified patterns persist after accounting for differences between hospitals.
 - ▶ Refresh the analysis with future CMS releases and track whether flagged hospitals and patient experience measures improve over time.
